

## Conserving and using drinking water wisely

Having water in sufficient quantities and in drinking water quality is something people often do not even think twice about. But even things we take for granted are worth giving a second thought, in order to opt in favor of conscious use of water as a resource. In this respect, EVI would like to provide some suggestions.

Each and every one of us can reduce their water consumption in daily life using very simple means, involving only minor changes in our daily routines, regardless of whether the weather is hot or it's raining. We have put together a few tips, which at first glance may seem very trivial, but they help all the same:

- When soaping up in the shower and when brushing your teeth, it is recommended to shut off the water and do not let it simply keep running.
- Only use the washing machine and dishwasher when they are fully loaded.
- Shower instead of taking baths, and try to use a water-saving shower head whenever possible.
- In the garden, using a rain barrel is always worthwhile, so that you can use rainwater for the longest time possible, instead of drinking water, for watering your garden.
- It is also important to conserve water as our resource by not contaminating unnecessarily, and by using detergents, shower gels and shampoos wisely and sparingly.
